

Make.com + Xero Payment Automation System

Project Overview

Designed and implemented an automated **payment verification and customer notification workflow** using **Make.com**, **Xero**, and **ClickSend SMS** to streamline payment status tracking and eliminate manual verification processes.

The system enables automated monitoring of customer invoices, identifies payment failures, sends status-based notifications, and automatically restores customer access once outstanding payments are completed.

Business Objective

The primary goal of this automation was to create a reliable payment compliance system that could:

- Automatically verify customer payment status through Xero
- Notify customers instantly based on payment results
- Maintain a record of customers with outstanding balances
- Automatically detect completed payments and update customer status from **Red Fail to Green Pass**

Project Challenges

The existing workflow successfully identified customers with failed payments and delivered Red Fail notifications, but it required an automated recovery process to continuously monitor those accounts and detect when payments were completed.

Key challenges included:

- Building a reliable customer payment tracking mechanism
- Creating automated status transition logic
- Preventing duplicate SMS notifications
- Ensuring accurate synchronization between Xero payment records and customer status

Solution Delivered

Developed a complete **Make.com automation architecture** integrating payment tracking, conditional logic, data management, and SMS communication.

Payment Status Tracking System

Implemented a structured data tracking process to store customers with failed payment status, including:

- Customer information
- Invoice details
- Outstanding balance
- Payment status
- Status update timestamps

This created a centralized system for monitoring and managing payment recovery workflows.

Automated Payment Monitoring

Created a scheduled Make.com workflow that periodically reviews customers marked with a Red Fail status.

The automation retrieves pending accounts and checks their latest payment information automatically without manual intervention.

Xero Payment Verification Integration

Integrated Xero to validate payment completion by checking:

- Invoice payment status
- Remaining balance
- Completed customer payments

The workflow applies automated conditions to determine whether a customer qualifies for a Green Pass update.

Automated SMS Notification Workflow

When payment requirements are satisfied:

- ClickSend automatically sends a Green Pass confirmation SMS
- Customer status is updated from RED to GREEN
- Payment resolution details are recorded for tracking purposes

Workflow Architecture

Scheduled Trigger (Make.com)

↓

Retrieve Red Status Customers

↓

Check Payment Status in Xero

↓

Apply Payment Validation Logic

↓

Send Customer Notification via ClickSend

↓

Update Customer Status Automatically

Key Features

- End-to-end payment status automation
- Xero accounting integration
- Automated SMS notifications
- Red to Green payment recovery workflow
- Scheduled payment verification
- Customer status management
- Duplicate notification prevention
- Error handling and workflow reliability improvements

Project Outcome

Successfully delivered an automated payment monitoring solution that improved operational efficiency by reducing manual payment checks and creating a seamless customer verification process.

The final system provides:

- Faster payment confirmation
- Automated customer communication
- Accurate payment status tracking
- Reduced administrative workload
- Improved service centre verification workflow

Technology Stack

Automation Platform: Make.com

Accounting Platform: Xero

SMS Platform: ClickSend

Data Management: Make Data Store

Workflow Components: Scheduler, Routers, Filters, Conditional Logic, API Integrations
